## Poetry.

### NO CROSS, NO CROWN.

No cross, no crown!
No cloud to shadow o'er our pathway here,
No sunlight everlasting for us there:
No sadness for our spirits now to bear,
No joy to come!

No cross, no crown!
No "armor" on to meet the conflict here,
No "palms of victory" to greet us there:
No mourning here, no songs of joy to share
Around the Throne.

No cross, no crown!
For every sorrow that our hearts now bear,
For every thorn that wounds, for every care,
There is a bliss laid up—a wondrous share
In that bright home.

No cross, no crown!
The heart that bears the heaviest weight of woe,
Hereafter will the brightest pleasure know,
Where rest and joy and peace eternal flow,
Through Christ, the Son.

No cross, no crown!
'Tis only for a little while that we
Must walk so burdened: even now we see
The shining crown awaiting us, when we
Our cross lay down.

No cross, no crown!
And he who bore the darkest, heaviest cross,
Without one stain of sin or earthly dross,
Metes out with gentleness each gain or loss,
To give his own.

No cross, no crown!
The way is rough, but we are not alone;
For he who once the same dark path has gone,
Goes now with us; and He will not disown
The weakest one.

## Miscellaneous.

### THE BIG KETTLE WITH TWO EARS.

I always wear it on my watch chain—not the kettle, but a piece of gold that came out of it—partly to remind me of the friend who gathered it, speck by speck, in a far-off land, and partly because I saw it made.

Yes I did, really. I saw it melted and rolled, and drawn, and cut, and milled, and stamped, and—

Let me begin at the beginning, and I'll tell you what I did see. It was at the Mint, and I saw my handful of dust carefully weighed, and taken, with ever so many pounds of other dust, to the melting room. In that room, over a furious fire, was a red-hot melting pot, waiting for its load of gold. A droll pot it was, too, with a spout, or "lip" they call it, to pour out the melted gold, and two ears.

You don't know what a kettle wants ears for? Well, I can tell you, and it's a funny use for ears, too; they are to lift it up by.

Into this odd pot, with two ears and one lip, went my gold, and all the rest, which nearly filled it. Wouldn't you like to see three or four hundred pounds of melted gold? It's a beautiful sight, and would be more agreeable to see, if it wasn't so fearfully hot near the furnace.

Hot as it is, however, it took several hours to melt it thoroughly; and, meantime, another workman to prepare the moulds by warming and rubbing them with oil. Not because the gold would stick, but to give it a smooth surface.

I had been wondering all the time, how the men would lift that big kettle out of the hot furnace; but when the gold was ready, and the moulds fastened up snug in a sort of carriage on wheels, I saw that it was arms of iron that lifted the kettle.

Do you know what a crane is? I don't mean a crane on two legs; but an iron crane, with one arm. If you don't know, just ask your grandmother. She'll probably tell you it's a sort of iron arm, that swings around on a hinge.

Well, one of these iron arms was swung around over the pot of gold. From the end of the arm, perhaps I ought to say, from the hand, hung a chain, with an immense pair of tongs at the end of it. These tongs seized the poor kettle by the ears, the chain was hauled up, and up came the pot of gold. Then the iron arm swung around till it was over the pouring machine, and the pot was carefully lowered into a "cradle," as they called it, where it rested on its ears again, poor thing.

After the machine was screwed up so that the pot couldn't slip, the tongs were taken off, and the crane swung around, out of the way. Pouring melted gold out of a monstrous pot into small moulds, would be hard to do without spilling half of it, but in this pouring machine it was beautifully done. There were two handles at one end of the machine, and a man stood there to manage them. By turning one handle he pushes the mould carriage up so that the first mould came exactly under the lip of the melting pot. Then by turning the other handle, he tipped the pot, and poured out the beautiful melted gold. When one mould was filled, he turned the handle again, and the next one moved up. So by using two simple handles, one man emptied the whole pot of hundreds of pounds of gold.

When the bars come out of the moulds, they are called ingots, and are a foot long, one third of an inch thick, and about an inch wide, in fact, about the size of a common school ruler. Of course they are too thick for coins, so I had to follow them to the rolling mill, for they roll most everything, now-a-days. Perhaps you have seen some kind of a rolling mill; if you haven't, I can tell you that the gold rollers look very much like the two rollers on a wringing machine.

The golden roller was made red hot, one man took it with a pair of tongs, and put it between the rollers. It ran through, and came out a good deal thinner, and longer, of course. Another man standing the other side, took it as it came out, and handed it back to the first one. He tightened the rollers and put it through again. And so it went back and forth, till it looked like a broad, beautiful gold ribbon.

But so much rolling made it too wide, and it had next to be cut into narrow strips. For this they had the funniest scissors you ever heard of. They are called circular shears; and are merely two sharp-edged wheels running together, the edges meeting all the time like a pair of scissors. The workman put the gold band up to the wheel, which seized and drew it through, cutting it as as easily as you can cut paper. It came out in beautiful, long ribbons.

But in spite of all the rolling and squeezing, the gold was still too thick for money, and to make it exactly right, they had a very curious process, called drawing.

First, one end of the gold ribbon was pressed quite thin by rollers. This thin end was put through a hole, in a hard steel plate, which hole was exactly the thickness and width that the gold must be. The end that was though the hole, was put into the jaws of a pair of pincers, that grip for good, I tell you. The pincers were then hooked on to a chain, which was drawn along by steam power.

It would be impossible for a man to draw a thick piece of gold through a thin hole, but this resistless chain moved along with perfect ease, drawing pincers, gold and all. Something had to give, you see; the steam, and the chain, and the pincers, were all stronger than the soft, precious metal, so it was drawn through the small hole, of course coming out just the width and thickness of the hole, and longer than ever.

The next thing was done by a boy sitting at a big machine that does nothing but champ, champ, all day.

The great steam giant living in the cellar, whose long arms lift the pots, turn the rollers, and draw out the gold, also keeps the cutting machine on the bite all day. The boy has only to feed it with the gold ribbon. Every time the cutter comes down, it bites off a gold piece, which falls into a box. It keeps the boy busy to supply it, so fast it cuts.

These pretty, round, smooth pieces of gold are called blanks, and from the cutting machine, they go to the weighers.

Probably you know that a five dollar gold piece is itself worth five dollars, and to have it so, it must be of a certain weight. The weighers are girls, who have each a pair of delicate scales before them, in which they try every piece. If too light, it must go back to the melting pot; and if too heavy, she runs a flat file around the edge of the piece, till it is exactly right. It is then ready to be milled.

Look on the edge of a gold piece, and you will see it is not flat, but in little ridges, or flutings. It is a curious thing to see that done. A child tended the milling machine, and all he had to do, was to keep a certain tube full of the gold blanks. At the other end of the tube is some machinery, and as soon as the blank reaches that point, it is seized and made to run over a short little bridge just wide enough for it, and with railings on the edges, to keep the blank on. As the piece runs over, a wheel running all the time over the bridge, presses down very hard on the blank; and when it runs over on the other side, the edge is found to be pressed up into ridges; or milled.

I thought I could never get tired of looking at that procession of gold pieces running over the funny little bridge, but as I wanted to see the last process, I had to go on.

The coining machine, which is the last, stamps the figures on, and changes a gold blank into a United States coin. This machine, also, like the cutting and milling machines, requires only a feeder, that is, a person to keep the tube full of blanks. The piece at the bottom of the tube is seized by a pair of steel fingers, carried off and laid in a steel bed,—not a cradle this time,—the same shape as the blank, but a very little larger. It is hardly there before a stamp comes down on it with great force, and the plain blank slides off a beautiful, perfect, gold coin.

You may be sure I picked up the first one I saw stamped, as mine; for after following my gold all through those long processes of melting, and rolling, and drawing, &c., I had no idea of running the risk of losing it. But though I had followed the gold from the kettle into which my gold went, of course I could not keep my grains separate. So I had to be content with a coin out of the same kettle.

In all these processes, a good deal of gold gets scattered about the building. Not in little pieces, for they are very careful of those, and every workman has to give back the same weight he received or about the same, in finished work and scraps; but a great deal gets off in the shape of fine dust. The workmen have to wash themselves before they leave the building, and the water is carefully examined for grains of gold.

What is still funnier, the sweepings of the floor have so much gold in them, that they have a regular machine to wash it out. Before this machine was invented, they washed the sweepings by hand and when they had got out all they could, every pound of dirt had still from fifty cents to a dollar's worth of gold in it. After going through the machine, it has only about seven cents to the pound.

How much money do you suppose they can coin at the United States Mint in a year? The snug little sum of sixty-three millions of dollars.

Did you ever think how inconvenient it would be not to have money? Instead of buying things, you would have to exchange. For instance, if you wanted to buy a book, you'd have to exchange a bushel of potatoes, or a piece of cloth, or anything you had, for it.

In some countries, people have used salt for money, in others, they have used shells. In old times, cattle were the standard of value. In Homer's works, shields are spoken of as costing ten cattle, or a hundred cattle apiece.

But the drollest money I ever heard of, is used by the Indians of Peru, and consists of,—eggs. What sort of purses do you suppose they have.—*Little Corporal.*

### A TRUE HERO.

A boy about nine years old was bathing one day when, by some mischance, he got into deep water and began to sink. His elder brother saw him and ran to save him, but lacking strength or skill, he also sank to the bottom of the river. As the two drowning brothers rose to the surface for the last time they saw a third brother, the youngest of the family, running down the bank for the purpose of trying to save them. Then it was that the dying nine-year-old acted the part of a hero. Struggling as he was with death, he gathered all his strength, and cried to the brother on the shore, "Don't come in, or father will lose all his boys at once!"

Noble little fellow! Though dying, he forgot himself, and thought only of his father's grief. He was a genuine hero. His brother obeyed his dying command, and was spared to comfort his father when his two dead sons were taken from the river clasped in each other's arms.

Boys you are not called to be heroes in this way, but you are called to consider the feelings of your parents, and to study how to avoid giving them pain. The best way to do this is to love them dearly. Love will not only keep you from hurting their feelings, but it will make you sources of great joy to their hearts. Blessed are those children whose words and deeds make sweet music in their parents' souls!

### MISSIONARY BEANS.

The *Journal and Messenger* has the following, of a man with missionary beans:

"He sent a half a pint of beans to the missionary meeting, requesting that two friends would plant them for three successive years, and give the entire product to the mission. At the close of the meeting the beans were counted, and numbered 256 in each quarter of a pint. Two individuals took them and at the end of three years a most enthusiastic meeting was held to know the result. One brother stated that his beans had yielded two quarters, three pecks, and three pints, which sold for about $26. The other brother planted his beans 16 inches apart. The first year he had eleven pints; the second year he had nine bushels, one and a half pecks; the third year 34 quarters, 1 comb, 94 bushels, one and a half pecks, which were sold for a little over $551—both crops realizing above $407 for the mission. The last brother offered to take another half-pint and try again, as he hoped for greater success. Another friend took a large potato to plant upon the same terms.

NEW BOOK STORE FREDERICTON.
PSALMODY, Sunday School Libraries, Packages Sunday School Cards, Theological Books. For sale by Fredericton, July 31. M. S. HALL.

THE NATIONAL
Life Insurance Company
OF THE
UNITED STATES OF AMERICA

WAS Chartered by Congress, in 1868, with a capital of ONE MILLION DOLLARS, every dollar of which was paid in before commencing business.

This capital is *four times* as large as that of any American Company doing a Life Insurance business exclusively. Beside this immense capital, the Company have invested a premium reserve to meet maturing Policies of seven hundred and sixty six thousand dollars, making their total assets to January 1st, 1871, one million seven hundred and fifty seven thousand dollars. Their liabilities on same date were $807,389, or in other words, they have more than two dollars assets for every dollar of liabilities. This success is owing to the facts that their business is conducted upon the only common sense plan—"so much insurance for so much money"—and that the Company's financial management has been economical and cautious.

In this Company there are none of the bewildering uncertainties and disappointments of "notes," "dividends," &c., &c., &c., which enter so largely into the business plans of Mutual Companies. The insured buy what they pay for—Insurance. They are not called upon to insure others, but they are insured by the Company.

Instead of charging thirty per cent. more than is necessary to cover possible losses, the National charges the net cost of Insurance and risks its capital to cover any extra mortality. Mutual Companies MAY not need to use this extra thirty per cent.; in that case it is returned to the policy-holder and she called a "Dividend." The National does not need any extra guarantee, its capital being sufficient, and consequently its rates are from 20 to 50 per cent. lower than those of Mutual Companies.

The National's Policies are more liberal than any issued in the Provinces, allowing residence or travel anywhere in temperate climates. No extra Premiums, Policy-fees, Permits, or extra charges, except upon the half-dozen occupations generally recognized as EXTRA hazardous.

The National is the only Company which has made the required deposit at Ottawa for the SOLE benefit of Canadian Policy holders. All others are for "POLICY-HOLDERS GENERALLY."

Five cents per day will insure a young man a thousand dollars, IN GOLD, payable to him at the age of sixty, or to his representatives should he die sooner. Four cents a day will insure a man, aged 25, for one thousand dollars, payable to his wife or children at his death, whenever that may occur. What easier way is there to make such a provision? Is it not worth your while to investigate?

Agencies are established throughout the Lower Provinces where the fullest information will be cheerfully given. Should there be none to whom you can conveniently apply, note addressed to the General Agent at St. John, will be promptly answered. Address

JOHN C. RISTEEN,
P. O. Box 428,
Saint John, N. B.

References in regard to the Company's standing will, upon application, be given to prominent men in all parts of the Lower Provinces. [mar 3.

FALL CLOTHS in great variety, for Suits and Roofing Jackets. Also, Light and Heavy Inverceauligs.

CARR'S PATENT CANT DOG.

THE advantages of CARR'S PATENT are—

1st. Simplicity and Utility combined. The bolt and nut, which are often working loose, being entirely dispensed with.

2nd. The Connection being low, the Dog never fails catching the log.

3rd. The width of the band gives additional strength to the Stock.

4th. It is the most Durable and Cheapest Dog now in use.

The subscriber having purchased the Patent Right of the above Cant Dog from James Carr, begs to inform all Lumbermen, Mill Owners and Wharf Builders, that he will have a Stock manufactured and will be able to supply any quantity after the middle of February. A sample may be seen at Subscriber's Store, and orders received so as to ensure an early delivery. Lumbermen, before fitting out, will please call and examine this Dog, as it will save them both in expense and labor. W. H. THORNE.
feb. 9 Market Square, cor. Dock St.

MANCHESTER, ROBERTSON & ALLISON,
oct 26 Market Square.

SPEIGHT'S
PATENT DESIDERATUM GLUE POT.

IT has hitherto been found in using any of the Domestic Glue Pots now before the public, that they have generally caused disappointment, for the Glue as soon as sufficiently heated, as speedily becomes chilled, owing to the cooling of the small quantity of water which can be used in melting the Glue. This inconvenience is avoided in the use of "SPEIGHT'S PATENT DESIDERATUM GLUE POT," where the Family Night Light not only dissolves the Glue, but will keep it in a hot and liquid state for several hours, and the necessity and manifest inconvenience is therefore obviated of having to place the Glue Pot on the bars of a hot grate or over a gas jet, as has been usually recommended, and is absolutely necessary in the use of any other Glue Pot. Another great improvement is the inner cup of porcelain which can be at any time removed for cleaning, and will be found equally useful for dissolving Gum, Isinglass, Gelatine, or any other adhesive agent.

The advantage of having a Glue Pot, the separate parts of which can be removed and cleaned, and when necessary renewed, is sufficient alone to recommend the article to public use, and altogether will be found of a character immensely superior to any other of the Domestic Glue Pots hitherto supplied, and will be admitted as a DESIDERATUM IN EVERY HOUSEHOLD, SHOP, OR COUNTING HOUSE.
For sale by GEO. STEWART, Jr.,
Chemist and Druggist,
may 19 24 King Street.
