Agriculture, &c,

HOUSE PLANTS.

The reason why it is so difficult to keep plants during the winter in our sittingrooms is that our rooms are too dry and hot for their healthy growth, and oftentimes too dark. Plants thrive best in a moist atmosphere, the heat varying with the natural requirements of the plant, and where they have plenty of light. It is not easy to overcome the difficulty, but the suggestions of the Buffalo Express on this point are valuable. It is suggested by the Express that the flower-pots be set in a box in which they can be plunged to the rim in moss, and the whole surface, except the earth in the pots, be nicely covered with green moss. This moss can be kept moist by sprinkling it with tepid water, and the evaporation arising from the moss will give a moisture to the air surrounding the plants. It will be found that plants treated in this way will not require to be watered as often as those standing with the pot exposed in the usual way. As often as once a week the leaves should be freed from dust by a good sprinkling from a fine-rosed watering pot, or what is better, a fine syringe.

Use of Lime in Agriculture .- The action of fime is twofold: first, physical, and second, chemical. As a mechanical agent it opens stiff clays, rendering them friable, mellow, and more easily worked; chemically, it acts upon the vegetable matter of the soil and sets free those stores of valuable substances which, without the action of this agent, must have remained inert and useless. It also enters directly into the composition of plants, and in many varieties forms a large proportion of the weight of their inorganic constituents. It neutralizes certain acids which are often present in soils, rendering them useful to vegetation, instead of being positively injurious, which they are in their original state. The existence of water in the soil, however, affects the action of lime very considerably. If the land is wet and undrained, lime will not exert the same influence which it would do in the case of thoroughly drained land. A greater quantity of lime is necessary to produce a given effect and thus the neglect of thorough drainage entails a considerably greater expenditure in liming than would have been necessary, if the land was either naturally or artificially dry .- Chemistry of Agriculture.

BUTTER FROM ENGLISH COWS. - An experienced writer gives the following estimate of the quantity of butter produced by a good English cow: "A good cow should produce eight pounds of butter per week in summer, and half of that in the winter, allowing from six weeks to two months for her being dry before calving. If she produces more, she is a superior cow; if less, below par. To produce this quantity the pasture must be good. Three acres should keep a cow in grass on hay for a year.

STEAMING CORN STALKS .- Corn stalks cut small and steamed make a most excellent and nutritious food for cattle. If but a little musty, the steaming would correct that and render the stalks sweet and palatable to stock. The addition of ground grain would make it very rich and fattening food. Horses do not thrive on such feed, nor would sheep; but for cattle it would be quite desirable and relish-

One great means of destroying most kinds of weeds is to keep the leaves and stems from appearing, by frequent mowings or cuttings. Cutting them before the seed have ripened, is, of course, absolutely essential, but not always sufficient.

TRANSPLANTING .- The secret of success in transplanting trees, is in carefully covering the ground after the trees have been well planted, with a good, thick mulch.

MICE. To keep the mice from gnawing your fruit trees, just wrap a piece of tarred paper around the trunk of the tree, extending upwards from the ground for about two feet.

The average cost of producing a bushel of wheat in Iowa is estimated at not less than eighty cents- so says the Iowa Homestead.

Ayer's

Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color

A dressing which is a once agreeable, healthy, and effectual for preserving the hair. I'nded or gray hair is soon restored to its original color with the gloss and freshness of youth. Thin hair is thick-

ened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can testore the hair where the follicles are destroyed. or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and v'gorous. Its occasional use will prevent the hair from turning gray or talling off, and consequently prevent ba'dness. Free from those deleterious substances which make some preparations dange ons and injurious to the hair, the V gor can only benefit but not harm it. It wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil por die, it does not soil white cambrie, and yet lasts long on the hair, giving it a rich glose y lustre and a grateful perfume.
