A Profitable Bargain.

FOR A GLASS OF BEER A DRUMMER GETS TWO HUNDRED THOUSAND DOLLARS.

This may seem a large sum for a small article but...

his mind and before he had passed an actual test he happened to be in a drinking bar. His finances were at this time at the lowest ebb, for his future pay was mortgaged for all it was worth, and the publican refused to trust him with any more drinks. An American drummer happened to be representing a large leather house and knew a good deal of the difficulty with which the American farmers of the Southwest had to contend. The two men got into conversation, and as a natural result the veterinary surgeon spoke of the idea that was uppermost in his mind, and said that he thought that he knew of a remedy for that most troublesome of complaints of which all horses in hot countries suffered. The American was perfectly convinced that he was talking to a man of good ideas, though bad principles, and asked what he would take for the idea.

"I am awfully hard up and can get no more drink on trust, so I will give you the idea for a glass of beer."

"Done!" said the other.
The American at once saw that there was probably millions in this, and he conceived the notion that the matter oozing from the sores on horses' necks would corrode the pad and produce sulphate of zinc—thus the disease would provide its own remedy. He also saw that zinc, being a non-conductor of heat, would keep the parts cool. The more he thought of it the more he liked it, and although his business should have kept him in Bombay some months longer, he in a few days took the first steamship for Liverpool and then for Boston. Arriving at Boston he threw up his appointment with the house, and started the manufacture of the zinc pads, after obtaining a patent for the idea, and is now worth \$200,000. These zinc pads are used in every country on earth and are the greatest blessings the farmer enjoys.—London Times.

I am willing to admit that man is my brother; but I contend, at the same time, that I have got a lot of kussid skaly relashuns.—Josh Billings.

TYPHOID FEVER.

ISSUED BY THE PROVINCIAL BOARD OF HEALTH OF NEW BRUNSWICK.

Typhoid fever is an infectious disease, lasting, as a rule, from three to four weeks. It is one of the diseases which is considered largely preventable, by the proper use of sanitary precautions, therefore a short study of its cause, dissemination and prevention will be of value.

THE CAUSE

Of typhoid fever is a living germ, which is contained in the stools and possibly in the urine, of persons having the disease. It is very important to remember that this germ is probably harmless when first passed from the patient, and just here is the golden opportunity of the Sanitarian. When placed under suitable conditions however it very soon becomes active, and moreover is thought to possess the power of multiplying indefinitely. Such suitable conditions are, filth, heat and moisture; for instance, badly constructed and ill kept water closets, privies, cesspools, sewers, drains or earth upon which slops have been thrown and which has become saturated with filth.

INTRODUCTION INTO THE BODIES OF THE WELL.

The germs of typhoid fever may be introduced into the system by breathing air which has become saturated by emanations from infected soil, or from water closets or vessels containing the discharges from the sick. Unquestionably however, in the vast majority of cases the poison is swallowed, and water is more often than anything else the vehicle for the germ. Food may also become infected, and milk is particularly prone to absorb germs of disease. How does the water and food supply become poisoned? In many ways. The discharges from a fever patient are thrown into a privy or cesspool, and may soak through the soil, for long distances, until the family well is reached. In the case of a recent Epidemic of typhoid fever in the United States, the cause was clearly traced to a case of the disease which existed outside the town. The patient lived upon the banks of a small stream, which lower down was dammed, and supplied a part of the town with water. The discharges from the patient were thrown upon the ground and ran into the stream; the germs were of course supplied to those drinking the water, and over one thousand cases of typhoid was the result. The clothes of a fever patient may be washed, and the water being thrown into a drain or cesspool or upon the ground, may produce the same result. Food intended for use by the well may be kept in too close proximity to the sick or his discharges, and become poisoned. It has been before said that milk is a good absorber of germs, and many outbreaks of typhoid fever have been traced to a milkman who had a case of the disease in his family. The milk had been kept too near the patient, or infected water had been used to wash the milk pans, or possibly to dilute the milk.

PREVENTION.

From what has been said of the nature of the typhoid poison, the methods to be followed in preventing its spread, will be apparent. Keep your houses in such a condition, that any stray fever germs can find no suitable place in which to become active agents for harm. Have good ventilation, good water or earth closets, good plumbing and good sewerage, and very much will have been done towards abolishing Typhoid fever from amongst us. Whenever possible, that abomination the cesspool should be abolished. Allow no decaying vegetables in the cellar, no piles of rotten chips, old bones and the like, to accumulate in the yard. The practice, common in the country, of throwing slops on the ground just outside the back door, is a dangerous one. It has been shown that in all such localities the germs of typhoid find a suitable home in which to multiply and become active; hence if they do not exist among us, the danger of the disease spreading is reduced to a minimum.

IN THE ACTUAL PRESENCE OF THE DISEASE WHAT MEASURES SHOULD BE ADOPTED?

It has been ascertained that a high degree of heat, and certain chemical substances, such as Corrosive Sublimate, Chloride of Lime, Carbolic Acid, Sulphate of Zinc and other, have the power when brought into contact with the germs of typhoid, of killing them. Bearing in mind that the poison is
