The Station-Master's Story

Across two fields I could see the little station peeping through the crimson and gold of the maples, half a mile away. I had no idea as to whether I should come near to train-time; I had not been living by the clock for a month past. But of one thing I was certain; I was not going to spoil this last day of my vacation by hurrying after a train that might have no existence.

So I loitered along, drinking in the glorious October air, lounging beside fences, and now and then stopping to add another view to those which were later to provide me with an illustrated record of my outing, and finally came out upon the platform, to find, to my satisfaction that there had been no train for three hours, and would be none, going my way, for two more. I was not in the least discomfited by this latter information. On the contrary, nothing could have been more in my mind. I should thus waste none of the splendid day, and should be able to "take" several of the beautiful bits by which the station was surrounded.

"I think I never saw a finer piece of road," I remarked to the station-master, as I set up my camera, nodding down the line which stretched away in magnificent perspective, straight as a die for five miles, with a perfect arch, which carried over it an intersecting road, to frame it in.

"You're right, sir," he replied, with evident pleasure at my appreciation; "there isn't another such bit for thirty miles."

"That straight run, together with one of the bravest men God ever made, saved a lot of lives a while back," he added a moment later.

Why, this was something like I heard myself on a truck, clasped my hands about my knee, gave one comprehensive glance over the lovely landscape upon which the western sun was casting long shadows, then turned to my companion.

Agricultural

WHAT HUMUS DOES.
How can one expect his soil to yield larger crops each year if he does not replace the plant food taken off by the previous year's crop? When a forest, where the leaves, weeds, twigs, etc., have decayed for centuries, is cleared away we say the soil is in its virgin state. Let us see what some of the advantages would be if occasionally we should supply humus by plowing under a heavy crop of field peas or clover. We mention these leguminous plants, for while they supply the much needed humus they also gather from the atmosphere one of the most costly fertilizers, nitrogen, when bought as a commercial fertilizer.

Humus aids in many ways to increase the yield of farm crops; among them may be mentioned the resting of the soil by returning to it all that was taken from it and sometimes more, producing a better medium for bacteria to live in. Bacteria are useful in aiding to tear down the soil particles and liberate potash and phosphoric acid, two of the elements essentials to plant growth. Decaying vegetable matter in the soil tends to loosen it, allowing plenty of air to circulate and prevent sourness. Plant roots need air as well as water, and both of these are supplied more bountifully on loose than on compact or baked soils. The water will percolate down, surrounding soil particles, and what is not used finds its way down through small openings that were made by the decay of root. From previous crops, and is deposited in a subterranean reservoir where it awaits the dry season. When drouth prevails the water trapped by the loose surface is pumped up by capillary attraction to within reach of the roots, but here stops, the capillary tubes being too large in the surface soil to carry it further and surface evaporation is prevented. Thus the plants may be kept fresh, green and growing throughout a severe drouth. Often the failure of a crop can be traced to the lack of table matter—humus—aids in the retention of a portion of each shower or allowing less to escape overland by ditch, creek and river.

In the spring crops are backward, starting, and the soil stays cold. Now, if there was an abundance of humus in the soil this would be different. This substance gives to the soil a dark color, and the greater the amount of humus the darker the color. Our muck beds contain more humus than any other soil and such soils come nearest the virgin state, although they are usually more or less deficient in the mineral elements necessary to plant growth. Dark substances absorb more heat than those of lighter color, so the more humus the more heat is absorbed, if properly drained, and the soil will be warmer earlier in the spring. Seeds require water in order to germinate, therefore for early seedbeds provide abundant humus. If we observe nature and follow her plans, we will supply plenty of humus for our soils, not only to furnish plant food, but also to improve mechanical conditions necessary to the welfare of our crops.

EXPERIMENTS WITH DAIRY COWS
Professor Brandt of Germany conducted three experiments with light and heavy dairy cows, each lasting four weeks, the second commencing 70 days after the close of the first. Thirty of the heaviest milkers in the herd were separated into lots of five cows each, according to live weight. The cows were kept under similar conditions to feed and care during the trial, none being bred after the beginning of the experiment. The average weight of the heavy cows was 1,265 pounds and of light cows was 979 pounds. The leading conclusions from the experiments are:
The milk of the small cows is richer in fat than that of the large ones.
Large cows eat a greater amount of feed than small cows; per 1,000 pounds live weight they eat less.
Small cows produce less milk than large cows, absolutely and relatively.
When in thin flesh small cows may produce more per 1,000 pounds gross weight than any large cows.
Large farrow cows are more persistent milkers; on the other hand, small cows show a greater tendency to fatten on the same feed, with a

poisoned blood may cause the cure can only be brought about by setting the kidneys right.
The experience of tens of thousands of men and women in Canada and the United States points to Dr. Chase's Kidney-Liver Pills as the most effective means of setting the kidneys right. No other kidney medicine can produce so much irrefutable evidence of its wonderful curative virtue. No other kidney medicine has received such hearty endorsement from physicians. Nor is this to be wondered at when it is remembered that Dr. Chase is a prince among physicians.
Nature has only provided one means of keeping the blood free from uric acid poisons—the kidneys. Nature's most effective invigorators of the kidneys are contained in Dr. Chase's Kidney-Liver Pills. Purely vegetable in composition, scientifically prepared from the great formula of Dr. W. V. Chase, thoroughly tested in thousands of severe cases, wonderfully efficient in all diseases caused by uric acid in the blood, Dr. Chase's Kidney-Liver Pills stand alone as the world's greatest kidney medicine. They prevent and cure disease by ridding poisons impurities from the blood. One pill a dose, 25c. at all dealers, or Edman, Bates & Co., Toronto.

Is It the Kidneys That Are Deranged?
If so uric acid poison is in your system and your sufferings will be great until you set the kidneys right—Dr. Chase's Kidney-Liver Pills make the kidneys healthy and cure all uric acid troubles.
The most painful, the most fatal and consequently the most dreaded diseases of the human body are caused by the presence of uric acid in the blood. Uric acid is the name given to the foul, poisonous impurities which are left in the blood when the kidneys are deranged and unable to perform their duty of filtering the blood.
If the kidneys are in perfect health the uric acid is passed out of the body by way of the bladder and the blood is kept pure and clean.
When there are severe body pains, headache, backache or weakness in the back; when the skin becomes yellow, dry and hard; when the urine contains deposits, is thick, or irregular; when there is stomach trouble and pains about the heart; when you feel weak, dizzy and become languid and despondent; you can put the cause down to uric acid in the blood resulting from deranged kidneys.
The nature of your ailment will be decided by your constitution. The poison left in the blood will find lodgment in the weakest part and set up some dreadful disease. It may be Bright's disease, diabetes or dropsy. It may be the wrenching pains of rheumatism. It may be chronic stomach troubles or bladder ailments. Whatever the form of disease this

FATTENING CATTLE.

The relative merits of quick and slower feeding have not yet by any means been determined, notwithstanding its importance. A great gap consequently exists in the practice of feeders, writes Thomas Shaw of Minnesota.
The argument in favor of quick fattening is in substance as follows: Feed the animals all they will eat of foods that are highly carbonaceous in character. Finish the animals in the shortest possible time, and there will be a saving effected in the food of maintenance. There will also be something saved in labor. For instance, if one animal is fattened, in the one instance in 90 days, and in the other instance, in 150 days, it is argued that the food of maintenance in the former instance for 60 days will all be saved, and also the labor of feeding the same.
The arguments in favor of slower feeding are somewhat as follows: If the animals are fed all the concentrated food they will take, some of them at least will eat in excess and enjoy the appetite, and all of them will eat more food than they will properly digest and assimilate. Much of the food therefore, will be wasted, since it will pass through the animal inappropriately. Much of the food will in this way be lost, and it is maintained that the loss in food will more than offset the saving effected in the food of maintenance under forced feeding.

GREEDY MACKEREL.
A Gorging Feast and the Way It Was Managed.
I once enjoyed the privilege of seeing an army of mackerel successfully conquer a shallow pool in a rocky shallow pool which was a cul de sac. The mackerel swam behind their victims in serried ranks, a company of hungry, determined creatures, intent upon a gorging feast to which there need be no limit. They had followed the fry for miles, merely swallowing one here and one there to keep their appetites whetted. Now they had cornered them where there was no escape for their victims. No alert fisherman on the lookout for just such an opportunity was at hand to convert their triumph and feasting into captivity and lamentation. They might feast at will.
Ah, ye gods, feast they did! No one who has not seen it would believe that the cubic capacity of a mackerel could possibly deal successfully with the number of small fish he actually swallows. The way he conducts the operation of feasting is unique. Opening his mouth wide, the mackerel darts in among the small fry, some of which are perhaps one-third of his own length. In an instant one of these is to be seen sticking half in and half out of his mouth. Then the mackerel gives one gulp, and the victim has disappeared. Without a moment's delay the process is repeated, and so it goes on so many times that the spectator cannot fail to be concerned for the immediate future of the particular mackerel he has watched. Yet nothing happens.
As for the fry, their helpless anguish is somewhat heartrending. The whole shoal of them bolts and churns the water in an agony of fear. High into the air they leap in order to avoid their voracious enemies, landing themselves often enough upon the weed covered rocks which skirt the pool and panting their lives out there rather than leap back into the seething mass of their harassed companions beneath.—Longman's Magazine.

What He Would Have Said.
In a complicated criminal case an old land surveyor was subpoenaed to give his professional opinion in the matter. As the proceedings were about to be concluded he was called to order sternly by the judge, who told him to wait till he was questioned. The case then proceeded. A host of witnesses were examined, and even the prisoner frequently was called upon to make a statement.
After a couple of hours the judge said to the old surveyor, "Now, sir, we shall be glad to hear what you have to say on the whole case."
The witness stood up and replied: "I only wished to remark awhile ago that I am quite deaf in my left ear and rather hard of hearing in the right. I was merely going to ask if I might be allowed to sit immediately in front of the witness and the prisoner. Up to now I have not heard a single word of the proceedings."—London Telegraph.
