A Few Interesting Facts!

THE SCOTTISH UNION & NATIONAL Fire Insurance Co of Edinburgh, Scotland, has Assets of \$16,230,784.42
The North British & Mercantile Insurance Co of Edinburgh and London has a capital of \$89,343,315.45
The Sun Insurance Co of London, England, is the oldest fire insurance office in the world. The London & Lancashire, The Hartford and the New York Underwriters are leaders. It would be impossible to find 6 more Reliable Fire Insurance Companies in the world to day than the above mentioned—no Technicalities, no Law Suits, but Honorable, Prompt and Satisfactory Settlement of all Claims
This is the established reputation of the above named companies of which

J. W. ASTLE is the Agent.

TRY OUR TAILORING

It Will Cost You Nothing

Because we guarantee Fit, Workmanship and Finish and if not satisfactory there is no obligation to take the suit.

Fancy Tweed and Worsteds,
\$17.00 per Suit up.

Fancy and Plain Homespuns,
\$15.50 per Suit up.

Blue and Black Cheviots, Serges,
\$18.00 per Suit up.

Trousers, all the New Shapes,
\$4.50 per Pair up.

It is easy to make a selection from our well assorted stock of the newest shades in clothes, comprising Greens, Greys, Browns, Bronzes in Plain and Fancy Patterns.

UNDER CANVAS.

Our Soldier Boys Settled Down to Business.

Although last Tuesday started in with a heavy rain accompanied by thunder and lightning the boys in red and in blue were on "deck" at an early hour. As the day advanced however, the sun came out good and strong drying up the mud making the first day in camp more pleasant than it would otherwise have been. The boys in the town companies were around bright and early, and the streets, no matter in what direction the eye wandered, were dotted with red of the infantry and blue of the artillery.

At 11.31 a. m. the Plaster Rock train rolled in bearing its quota of men from Centreville, H Co. and from Hartland E Co. also the Brighton Engineers from Florenceville. They paraded at the station and marched to camp, in the meantime companies A and D from Woodstock had already gone into camp.

The tents which had arrived the day before from the government stores had under supervision of Quartermaster H. P. Carvell and Capt. Margison been raised and were ready for the troops when they arrived.

Major Good was a very busy man from early morning. Horses began to arrive from different parts of the county, those that had been engaged for the 10th Field Battery and a very busy scene followed. About 10.30 the battery paraded and with clanking of harnesses words of command and rumble of the guns the 10th with the gallant major in the lead swung into line and headed for their ground. These same guns that the people hear every day and which fired the salute yesterday it being Dominion Day, are the same guns that barked savagely in South Africa, belching forth death and destruction during the Boer war. Complimentary remarks were made as to the very neat appearance of the battery; the fine horses, fine guns and sturdy looking lot of men the major had with him, men who in a scrap would give a good account of themselves and gear. It was also remarked by an old artilleryman that the horses were as fine a looking lot of horses as ever hauled a gun.

On the arrival of the 5.45 p. m. express with companies F from Andover and G from Edmundston accompanied by the band the number of men in camp all told is about 500. When the six companies of the 67th Regiment, one company of the Engineers and the 10th Field Battery arrived at the grounds the camp took on a scene of activity which to one who never saw a military camp looked like confusion but to the initiated in military training, things went like clockwork. Guards were formed, sentries walked their beat, preparations made for the first night in camp.

Lieut-Colonel Dibblee is Commandant, Lieut-Colonel G. D. Perkins is in command of the 67th Regiment, Capt. A. H. H. Margison is Adjutant and Orderly Officer.

Capt. J. J. Bull is musketry instructor, Rev. Goring Alder, Chaplain, Major Good is in command of the 10th Field Artillery, Maj. John R. Tompkins commands the Brighton Engineers. Quartermaster Sergt. Slade of Royal Regiment Canadian Artillery Kingston is Instructor of gunnery, in the Battery and Sergt Woods and corporal Etienne of R R C I are instructors.

A large marquee tent has been erected for a reading and writing room for officers and men.

On Sunday church service will be held on the field. Chaplain will officiate. The hymns which have been arranged for the band by bandmaster Geo S. MacLaughlin by order of the Dep Officer commanding will be played during the service.

Intoxicating liquors have been strictly forbidden in or near the camp grounds.

Quartermaster Major H. P. Carvell. The companies by seniority with company Commanders and Lieutenants 67th Regiment.

The 10 Field Battery goes into camp with 82 men, 57 horses of which 32 are draft horses and 25 saddle horses.

The Brighton Engineers have 110 men and 18 horses. While the 67th Regiment have 290 men all told. Of course the companies are not up to the full strength of other years as the government thought it wise to cut the strength down somewhat. The strength of the band is also cut down to 17 men.

On account of it being near time for going to press we have to cut out several articles that we wish to get in this issue concerning the camp but will give a good account of the soldiers as the camp progresses so get a paper and read what is interesting.

The difference due to spaces between the sticks of course depends very much on the shape and size of the sticks. Straight, smooth sticks lie close together, and a cord contains more wood and less air. For given lengths, sticks of softwoods are usually straighter and smoother, and when stacked lie closer together. But whatever the kind, cords of long sticks are pretty sure to contain more empty space than cords made of short pieces. Likewise, cords of split wood contain less than cords of round sticks.

The finer the wood is split, the more it makes. Hence wood dealers are often willing to sell kindlings, all sawed and split, for the same price per cord as unsplit wood. They get back the cost of labor in the increased bulk.

A cord (128 cubic feet) of 4-foot hardwood usually contains about 83 cubic feet of solid wood; a cord of 3-foot wood averages 83 1-2 cubic feet; of 2-foot wood, 84 feet, and of 1-foot wood 85 feet. The cuttings, softwoods, contain 69 to 96 cubic feet.

A cord (128 cubic feet) of 4-foot hardwood usually contains about 83 cubic feet of solid wood; a cord of 3-foot wood averages 83 1-2 cubic feet; of 2-foot wood, 84 feet, and of 1-foot wood 85 feet. The cuttings, softwoods, contain 69 to 96 cubic feet.

A Cord of Wood is a Variable Quantity.

When is a cord not a cord?

To the farmer harvesting his small woodlot and to the man laying in logs for the large fireplace of his country or sea-side home; to the paper manufacturer buying pulpwood and to the proprietor of the ordinary city woodyard, to all these men this question has an important dollar-and-cents meaning.

Queer to say, and contrary to the belief of most people, there are many times when a cord is less than a cord, and many conditions when it is more. School arithmetics say that a cord of wood is 128 cubic feet, or the contents of a pile eight feet long, four feet high and four feet wide. Wood is marketed on this basis. A pile whose length, breadth, and height multiplied together gives this number of cubic feet fills this requirement, no matter whether the sticks are long or short, straight or crooked, round or split, unless there is an understanding to the contrary, nevertheless, a cord, though it comes up to legal measurements, is an uncertain quantity, even when the seller is honest and the buyer satisfied.

A lumberman may have a tract of pulpwood which he sells to a paper mill at \$5 a cord, for as many cords as it will make. It is in the contract that he shall cut and stack it. He cuts it in 12 foot lengths, and when the job is complete, it means 200 cords, and he receives \$1,000 for it.

Would we have made or lost by cutting 4-foot lengths instead of 12?

He would have lost in the first place from the additional labor required to cut 4-foot wood, but his principal loss would have resulted from a greatly diminished number of cubic feet, due to the fact that short sticks lie closer together than large.

Measurements and experimental tests have been made to ascertain exactly how much actual wood is in cords of different lengths, sizes, shapes and species.

Had the 200 cords of 12-foot wood been cut in 4-foot lengths, there would have been only 176 cords, and the owner would have received for it \$880 instead of \$1,000. It was, therefore, clearly to his advantage to cut 12-foot lengths, but it would have been to the buyer's advantage to have it cut in 4-foot lengths. He would have received the same actual quantity of wood for \$120 less.

It also makes considerable difference to the seller whether wood is chopped or sawed. If chopped, the chips are lost. Where the logs are large this loss amounts to no small total. In a cord of 4-foot wood, with sticks 6 inches in diameter, the chip loss is from six to eight per cent; and of course, the shorter the sticks are cut the greater the loss. If the wood is sawed, the saw dust loss is scarcely the half of one per cent.

The difference due to spaces between the sticks of course depends very much on the shape and size of the sticks. Straight, smooth sticks lie close together, and a cord contains more wood and less air. For given lengths, sticks of softwoods are usually straighter and smoother, and when stacked lie closer together. But whatever the kind, cords of long sticks are pretty sure to contain more empty space than cords made of short pieces. Likewise, cords of split wood contain less than cords of round sticks.

The finer the wood is split, the more it makes. Hence wood dealers are often willing to sell kindlings, all sawed and split, for the same price per cord as unsplit wood. They get back the cost of labor in the increased bulk.
