WHEN COTTON BALES BURN.

Firemen Always Dread That Type of Warehouse Configuration.

A type of fire that the firemen dread is a great deal is a blaze in a cotton warehouse. These fires generate an immense amount of dense, suffocating smoke and because of this fact have to be fought almost exclusively from the outside of the building. The smoke is of too dangerous a character to allow the men to remain any length of time inside. Therefore the fire fighting has to be done entirely from the outside, by pouring great streams of water through the windows and doorways until it is finally "drowned out."

There is an added danger at fires of this type that is not generally known. The cotton bales are packed so closely in these buildings, with practically no space between them, and such an enormous amount of water must be used to extinguish the fire, that the cotton absorbs the water and begins to swell. And the "swelling" or expansion of the cotton has been sufficient in a number of cases to force out the walls of the building, causing the structure to tumble into the street and within a short time after the outbreak of the fire.

This was the case at a fire in a cotton warehouse in South Brooklyn several years ago. Within three-quarters of an hour after this fire started, although it was in a substantial looking stone building, the walls came crashing down and crumbled into a mass of rubble.

Charles T. Rhodes, a well-known fireman, said: "I have seen many fires in cotton warehouses, but I have never seen one like this."

WILY CECIL RHODES.

The Way He Discovered the Diamond Fields of South Africa.

Have you ever heard how diamonds were discovered in South Africa? And did you know that Cecil Rhodes was the man who made the discovery? But here is the story:

A German trader in skins and ostrich feathers from the interior, with Pietermaritzburg as his frontier station, drove into Cape Town one afternoon. He had been two months bringing in his wagons, each drawn by ten yoke of long horned oxen, from the frontier trading post named.

This trader, among other curious things, had a dozen or so very brilliant pebbles, which he was showing to his friends.

"Fine specimens of globular quartz," said a doctor newly arrived, who had just enough of a smattering of geology to know nothing at all about it.

"Would you mind giving me one or two of those pebbles?" said a tall, dark skinned, slender young man. "Or I will buy them from you at whatever you may consider them worth. I have no such stones in my collection at home."

"My dear sir," the other replied, with the heartiness of a dweller on the veldt, "you are very welcome to a couple. Pick out any two you may fancy."

The dark young man selected two about as large as a medium sized hickory nut, thanked the trader and immediately sent the "globular quartz" to Amsterdam. As he thought, the report came back saying that the stones were diamonds of incomparable fineness. Then started the rush to the diamond fields.

BLACK BASS NEVER SULK.

When Hooked These Gammy Fish Always Fight to a Finish.

The black bass is the type of the lesser sized game fishes of America.

Why? Because he is not only great in muscular energy and fights like a bulldog, yet in his strenuous efforts to escape shows almost human intelligence. He will run in and then on a slack line leap into the air and shake his body in his efforts to dislodge the steel. Falling, down in the pool he surges and darts around a sunken rock, as if to sever the gut leader on the sharp or scraggy edges, or, failing, seek the bottom and there, unseen, brace his pectoral fins between two small rocks and in this fortress of defense jig, jig, jig on the line much as a dog jerks at a rope held in the hand.

Some anglers have compared this action of the bass to the sulk of the salmon, which is reflective on the bass that never sulks, but is ever in action and fights to a finish.

But these traits of the black bass are like stories many times told to the old angler for "bronzebacks," but the young 'un perhaps is yet to pass through the thrilling experience of fighting an impaled bass with a light rod, a gossamer leader and a feathered fly, and it is well to warn him of the acrobatic gyrations of the Micropterus salmoides, for such is the scientific name of our lordly fighter—all outdoors.
