ELECTRICITY FOR USE.

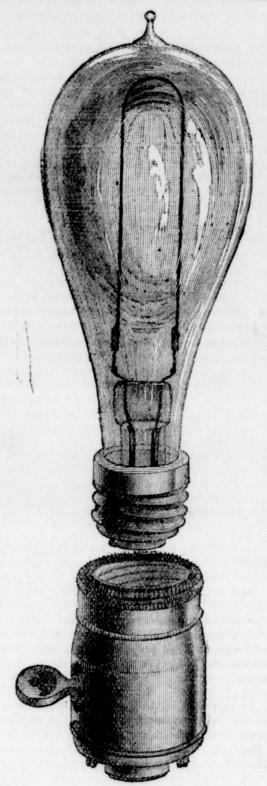

SOME DESCRIPTION OF INCANDES. CENT LIGHTING OF TO-DAY.

Some of Its Advantages Over Gas-Illustratrations of the Thompson-Houston and Brush Lamps and Dynamos, and Edison's Incandescent Lamp and Dynamo, Etc.

The electrical exhibition has given a decided boom to electricity as a lighting and power agent. St. John people are always ready to appreciate a good thing, and the manifold advantages of electricity have been set forth so plainly that the interest of rich and poor has been aroused.

There is an old adage the substance of which intimates that a man's heart is in his pocket; the moment you touch one you are in contact with the other. Whether this be the mainspring of the sudden interest in electricity as a thing for use, is hard to say, but no one can deny that the merchant who is assured that he can illuminate his large or small store for less money by electricity than he can by gas, takes a deeper interest in the cheaper and better lighting material.

Their admiration was excited first in the exhibition building by the rare beauty of the scene about them, by the brilliant flashing parlor incandescent lamps, and the dazzling ling rays of the larger are lamp more fitted | than one-twentieth of gas and about onefor store or street illumination. Their interest was aroused by the electric welder. There was something to interest everybody | introduction into places where artificial from the boy with his box of broken tools at home, to the old gentleman who has seen

EDISON'S INCANDESCENT LAMP

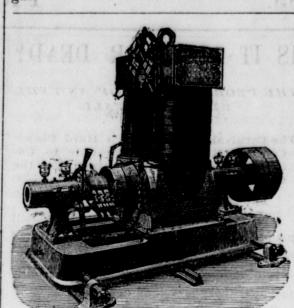

great strides in his day, even from the primitive and imperfect welding methods of his young days. Here was a machine as simple apparently as any about them. There was no glowing forge, no anvil, no muscular assistants to swing the hammer. A neat and natty young gentleman dressed as such, in less time than it takes to describe it, would take two broken pieces of iron or steel rod, place their ends together in a place prepared for them in the welder, turn on the electric current, and in a few seconds the fractured ends are at a white heat and joined so securely that the rod would break as quickly at any other point as where the pieces are joined. The practical use of the welder is so apparent that it has attracted greater interest than almost anything else in the exhibit.

People with wealth and handsome residences were greatly taken with the incandescent system of lighting. There is a mistaken idea abroad that it is dearer than gas. If there is any difference, the incandescent lamp has it, and what a difference between the lights!

Progress undertakes this week to give its readers some idea of electrical lighting, motors and machinery. The interest aroused by the electrical exhibition is more than ordinary, and the information comes at a time when it will be appreciated and understood.

More is known in this section of the arc-that in use in the stores at presentthan the incandescent lamp. The latter is likely to replace gas, to a great extent, in this city, as it has already in many American and some Canadian population centres. are lamps are in use in this city. That on represented above, is in the carbon within the globe, which requires no expense of inspection or attention, until it is exhausted, elaimed that the incandescent light is even; that it ranges from 16 to 250 candle power, and that by grouping it will equal, or even excel, the arc light. The construction of the lamp above is interest-

nearly exhausted of air and sealed as securely as possible to maintain the vacuum. The carbon is rendered incandescent by the opposition it offers to the current passing through it, and thus emits a soft, mellow light, steady and exceeding in brilliancy the illuminating power of a jet of the best

AN EDISON MOTOR

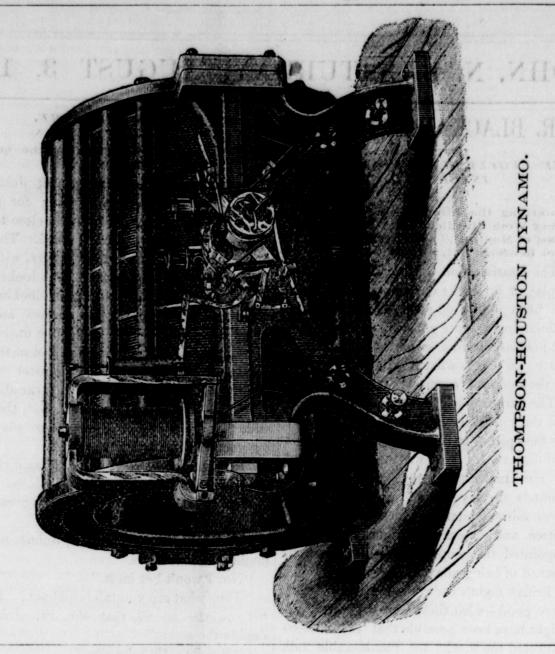

In a few of the advantages of incandescent light may be included the absence of soot dirt or gases and the consequent condition of ceilings and decoratings; the small quantity of heat given off being less fortieth of that of a wax candle; its safety, which has become world wide and led to its light has been forbidden; its application in places where gas could not be used from the fact that there is no flame and no heat; its cost, which does not exceed that of gas, and is less when the saving in items of depreciation of decorations, pictures, etc., is considered; it can be lighted or extinguished in an instant.

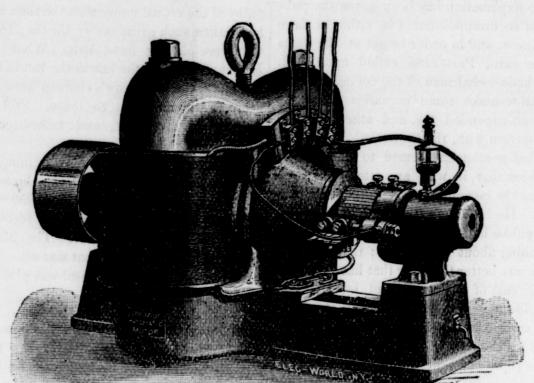

A little more space is given to this subject than would be warranted, but for the fact that it may be introduced in the city before long. A writer describes a private house lighted by incandescent lamps:

As we enter the door, we turn a switch close at hand, and immediately the hall is lighted; another switch placed in a convenient position at the parlor door controls the chandelier. The dining-room is the dining-room the kitchen lamp is controlled. A switch at the head of the stairway lights the cellar, and enables one to go into the coal vaults without a candle and its usual provoking episodes. The lamp over the back porch is serviceable in case of intrusions of man or beast at night, in which event the ever ready switch casts confusion on the trespasser and light on his doings, serving as a protection at a very slight cost. Such lamps are of use every night in winter and are worth many times their cost. Returning to the parlor, we extinguished each lamp as we pass its switch, leaving [the rooms behind us in darkness. Wishing to go upstairs, we turn the key of a switch. which lights the lamp in the second story hall, and when we have reached the landing we put out the lamp below by means of a second switch. Inside each bedroom hangs a switch on a flexible cord; press the button and the room is lighted. The cord is long enough to reach the head of the bed, so we hang the switch on a brass hook on the headboard, and it is in easy reach from the bed, ready for use at any time of night. As we go out the hall, we hang the switch on its hook at the side of the door, where we can reach it as we come back, and, pressing the button, the room is dark. So each room is inspected, and the convenience and economy of switches made manifest. The light is in use only

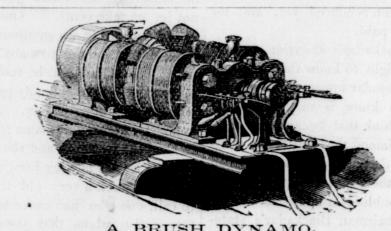

Some of Progress' readers outside of St. John will take a greater interest in the two cuts below than the people in the cities who use them every night. Both of these tract. TWO LOVES.

I wonder if a certain lane As when my first love, Ellen Jane,

There took her daily airing.

My lollipops I shared with her, And, daintiest of misses, For every sweet, without demur, She paid me off in kisses.

My latest love is Eleanor,
The Jane is quite derided,
And though I still divide with her, My pay is undecided.

Sometimes when sweets and flowers most rare I on her shrine am showering, Her smiles with sunshine fill the air, But ah! too oft she's lowering.

No matter how I strive and woo, No more for me such bliss is To see her—as she used to do— Put up her mouth for kisses.

Sweet Eleanor, though grown are we, My love bring more of pain Than when your summers numbered three And you were Ellen Jane.
