

the importance of marginal compounds and other materials to make the soil more suitable for crop production and to help increase soil productivity and reduce erosion.

After the initial analysis, a suggestion was made to add organic manure to the soil to increase its productivity. This was done and the results were encouraging. A summary of the results shows that the addition of organic manure has increased the yield of the crops by 10-15%.

In the next phase of the study, the effects of different types of organic manure on the growth of various crops were examined. It was found that the best results were obtained with the use of animal manure, which increased the yield of all the crops by 15-20%.

Finally, the results of the study were presented at a national conference. The findings showed that the use of organic manure can significantly increase the yield of various crops. The results also indicated that the use of organic manure can help to reduce soil erosion and improve soil quality.

RESULTS AND DISCUSSION

The results of the study show that the use of organic manure can significantly increase the yield of various crops.

The results of the study also indicate that the use of organic manure can significantly increase the yield of various crops. The results also indicate that the use of organic manure can significantly increase the yield of various crops.

The results of the study also indicate that the use of organic manure can significantly increase the yield of various crops.

To sum up, the results of the study show that the use of organic manure can significantly increase the yield of various crops.

CONCLUSION

In conclusion, the results of the study show that the use of organic manure can significantly increase the yield of various crops. The results also indicate that the use of organic manure can significantly increase the yield of various crops.
