

THE END OF THE WORLD

around in the form of a sphere. From this profound conclusion of Einstein's many facts can be derived by analogy with the world. Dr. Priestman drew his analogies from considerations of a "galoot" on the surface of the earth. The first inevitable conclusion from the law is that if one travelled out into space in a straight line in any direction one would always arrive at the starting point; hence space can be considered as unbounded. Nevertheless, space is limited and the surface area, and volume of our space can be calculated. There is a definite amount of space. Moreover if one travels out into space in any direction one will finally come to a point where the boundary of his space will have diminished until it is a single point.

Dr. Priestman also considered the size of space. According to Newton's theory and Einstein's earlier theory there was a definite attraction between bodies. Einstein's later theory lead him to the conclusion that there is a definite repulsion between bodies, which increases as they get farther apart. Astronomers consider that the size of the space is determined by a balance between this attraction and repulsion. Originally the universe consisted of a thin sphere of gas in space, which began to condense to form galaxies and stars. This condensing upset the delicate balance of space, which lead to its expansion. If these conclusions are correct one might reasonably suppose that the galaxies would be moving away from us and that those the furthest away would

be moving the fastest, The astronomer ought to see this.

At this point Dr. Priestman dropped the subject, leaving the truth or falseness of the above conclusions to Dr. Toole's lecture next Tuesday evening. Dr. Toole will consider chiefly the time element in regard to "The End of the World" at this time, the lecture being illustrated by many descriptive and original slides.
