

Lockheed Martin plans to cut down Woodlot with "Giant fucking lawnmower"

CLICKITY CLICK
THE BIASWICKAN

Lockheed Martin wants UNB to know about the threat amassing in its backyard.

The company, who is the world's largest defence contractor, claims they recently received information about giant rodents taking over the university's lands located south of Prospect Street.

Lockheed Martin has learned that the group goes by the name Beavers.

The creatures are easily identifiable by their disturbingly large size and "freaky, mutant tails," says Aldridge Edwards, member of Lockheed Martin's board of directors.

While many Fredericton residents might think that this is a new threat, representatives from Lockheed Martin claim that the animals have been infiltrating Canadian culture for years.

"We recently discovered these 'beavers' have been secretly involved in politics and culture for years – these guys are in deeper than the masons," explains Edwards.

"They have contacts in the highest levels of government. These sick rodents are even on those little 'novelty' coins – nickels," says a shocked Edwards.

On a community level, Lockheed Martin claims the beavers have been chopping down trees – with their teeth – for years in order to slowly increase the

levels of carbon dioxide in the air around Fredericton.

Edwards claims the only way to deal with the beavers is to strike now, before they can amass more power.

"There is a threat gathering against us that we cannot ignore. These creatures are obviously attempting to harm us. We cannot wait for conclusive evidence – we're too impatient – and the smoking gun that could come in the form of a mushroom cloud, or giant, tree-sized arrows," says Edwards.

In order to deal with the threat, Lockheed Martin has joined forces with the Coalition of Peaceful Frederictonians.

The coalition has released a statement reading: "these beavers are evil. They need to be taught a lesson and be dealt with in the worst way possible."

To deal with the threat, Lockheed Martin has pooled their resources to create a weapon that they call "John Deere cracked out on steroids."

The weapon weighs nearly 15 tonnes, roughly the weight of a loaded dump truck. The prototype, which is tentatively referred to as "Treeminator," looks just like a ride-on lawn mower – except that it can chop down entire trees in seconds.

Essentially, Lockheed Martin plans to cut down the entirety of the UNB woodlot with "a giant fucking lawnmower," says Edwards.

No beavers were available for comment at the time of print.

This lawnmower could do more damage than anyone could possibly know to the UNB Woodlot, mostly because it is so huge and awesome.
