

# Theatre of The Air

## TUESDAY'S PROGRAMMES

**CFNB, FREDERICTON, 550 K.**  
 8.00—Musical Clock  
 8.30—M. M. A. Talk  
 8.35—Listening Post  
 9.00—Birthday Program  
 9.30—Concert Songs  
 9.45—Morning Concert  
 10.15—Thor Program  
 10.45—Enterprise Foundry Program  
 11.00—Happy Warrior Hour  
 12.00—Purina Program  
 12.15—Building Products Program  
 12.30—Canada Starch Melodies  
 12.45—Sherwin Williams Musicales  
 1.00—Frigidaire Program  
 1.30—Marconi Radio Hour  
 2.00—Rosario Bourdon  
 2.30—Royal York Concert Orchestra  
 4.30—Tea Dance  
 5.15—Musical Comedy Memories  
 4.45—Concert Hall of the Air  
 5.00—Monitor News  
 5.30—Musical Comedy Memories  
 6.00—Fireside Hour  
 6.15—Canada Cement Program  
 6.30—C. C. M. Program  
 6.45—MacDonald Program  
 7.00—Valley Motors Program  
 7.30—News  
 7.17—Sports Review  
 7.30—News  
 7.45—Dinner Hour  
 8.00—Educational Talk  
 8.15—Chateau Frontenac  
 8.30—Young Tim  
 8.45—Hors d'Oeuvres  
 9.00—Show Time on Air  
 9.30—Jazz Nocturne  
 10.00—Road to Yesterday  
 10.30—No Mournful Numbers  
 11.00—By Moonlight  
 11.30—Address  
 11.45—Press News

## WEAF, NEW YORK, 660 K.

5.00—Woman's Radio Review  
 5.30—Girl Alone  
 5.45—Women's Clubs

## THIRTY-FIRST ANNUAL MEETING N. B. FRUIT GROWERS, INC.

(Continued from Page Three)

This should have the result of making the variety more favorably and widely known and assist in finding sale for all or a large portion of the 1936 crop of Dudley in the province.

### Advertising Our Apples

Last year in my report I suggested the possibility of making some of our lesser known varieties of apples more favorably known to the general public and thereby stimulating the New Brunswick demand for them. Information has been secured as to the probable cost of colored illustrations of these varieties with the idea of incorporating the same in a pamphlet or booklet with various apple recipes, descriptions of varieties and their adaptations for culinary and dessert purposes, etc.

Work of this kind is rather expensive and so no definite steps have yet been taken. However, the matter is still in mind and will be worked on and further information secured. The first idea that we might have colored illustrations of six or eight varieties but in order to get something done without too much cost it might be well to limit the illustrations to two or three varieties.

To illustrate the importance of this matter let us take the case of the Cortland. This is one of the new varieties which this Department has introduced. With this spring's planting there will be approximately 6,500 trees of this variety set out. With the production growing each year and the variety being little known some advertising matter in regard to it and its particular uses and qualities might greatly assist in the marketing.

### Amendments to the Injurious Insect And Pest Act

In March, 1934, the New Brunswick Fruit Growers' Association requested that certain amendments to the Injurious Insect and Pest Act, being Chapter 43 of the Revised Statutes, 1927, be enacted at the then present session of the Legislature. However that was not done and no action was taken on the matter in 1935. However, on March 19th of this year I wrote to Mr. J. K. King, Deputy Minister of Agriculture again in regard to this matter and suggested that these amendments be enacted at the present session of the Legislature. Accordingly, a bill was prepared, introduced into the House and is now under consideration.

The purpose and intention of those amendments was to strengthen and bring the Act up to date as to place the Government in a position whereby it might, at any time, through the issuing of regulations by Order-in-Council, take any steps which might be deemed necessary to deal with the Apple Maggot situation or with any emergency situation which might possibly arise at any time in connection with any insect pest, bacterial or fungus disease affecting any crop.

Other subjects that will be dealt with later in this meeting are the apple maggot situation, new varieties under test, and the need for varieties that will extend the season of the McIntosh

"Some Observations on Apple Diseases in New Brunswick" was the title of a most interesting paper read by Scott F. Clarkson, graduate assistant, Dominion Laboratory of Plant Pathology, in this city. Mr. Clarkson's paper today was as follows:

The damage occasioned by winter injury to apple trees throughout the province in 1933-34 became more apparent during the season of 1934-35. Trees which had been severely frosted the previous season were killed outright, while others showing no apparent injury in 1934 manifested during the growing season of 1935 bark splitting, cankers and other injuries responsible for reduction and loss of leaves, fruit drop and undersized apples. The following types of frost injury are now apparent in apple orchards under observation: bark splitting, crotch injury, black heart, twig injury, and cankers. Owing to the fact that these injuries may serve as avenues for infection by fungi more attention must be paid to the question of plant diseases caused by this agency.

Experiments conducted at the laboratory of Plant Pathology, Fredericton, revealed that frost injured twigs and branches were only about 50 per cent as efficient in any conductance as uninjured branches. This condition is responsible for a lowered vitality and a consequent greater susceptibility to disease. Both superficial and deep frost cankers may serve as avenues of infection for various fungi. A common fungus associated with frost cankers in this province is

## R. Drury Anderson

BARRISTER and SOLICITOR

CHESTNUT BUILDING  
 PPHONE 69-21 380 Queen St.

Schizophyllum Commune. This fungus can readily be recognized by its white, leathery fruiting bodies scattered over infected branches. Each fruiting body is capable of liberating many thousands of spores or seeds which are capable of infecting wounded but otherwise healthy trees. This year's pruning operations should be directed towards cutting out all the branches infected with the Schizophyllum rot. The destruction of all excised dead and diseased branches and limbs, by burning, cannot be too strongly emphasized. All pruning wounds should be coated with a Bordeaux paint.

### Apple Scab

This disease was of little commercial importance in orchards where the recommended spray programme was followed. In some cases, however, where growers neglected to follow the standard spray schedule, apple scab effected serious damage to foliage and fruit. The success of any spray programme is entirely dependent upon the timely application of the fungicide. Failure to spray at the correct time defeats the whole purpose of the operation.

### Black Rot

This fungus disease has a wide geographical distribution, an extensive host range, and is becoming increasingly important in this province. The fungus attacks the twigs, branches, leaves and fruit. On the leaves it produces a striking frog-eye spot and characteristic cankers are formed on the branches. Severe leaf infection may result in loss of the leaves. Severe fruit infection results in the reduction of affected parts of a coal-black dried up mummy. The fungus causing the black rock disease is a wound parasite and readily gains entrance through wounds and frost cankers. The standard sprays, Bordeaux and Lime Sulphur, effect little, if any control of this disease. Other preventive measures should be practiced, therefore, to effect partial control. These include the following: (1) Prevention of wounds on trees and fruit; (2) Removal and destruction of infected fruit; (3) Care in pruning and destruction of cankered limbs; (4) Removal of fallen fruit prior to rot development. Plans have been completed for a thorough investigation of the organism causing black rot and efforts will be made to develop means for effectively combatting the same.

### Apple Russetting

This trouble is a serious limiting factor in the production of commercial apples. Russetting is a condition brought about by localized injuries to the surface cells of the fruit and the consequent formation of underlying cork cells, which rupture to the surface and form the characteristic brown, rough skin. Russetting is believed to be caused by several agencies as: (1) damp, foggy or rainy

## A Restaurant That is Different!

Restaurants have their own personality as much as persons.

weather immediately following Bordeaux applications; (2) the use of excessive quantities of Bordeaux mixture; (3) the application of too strong spray solutions; (4) mechanical injury to fruit; (5) soluble toxic compounds in the spray mixture, such as arsenicals; (6) light spring frosts which may injure the pistil of the flower.

Preliminary observations indicate that the standard fungicides are not wholly responsible for this type of injury. The seriousness of this condition prompts a definite study of the factors instrumental in causing the same. A co-operative project between the provincial department of agriculture and the Dominion Laboratory of Plant Pathology has been arranged to study this problem during the coming season.

### Apple Storage Diseases

These diseases are ordinarily of little importance to the grower in this province but their importance cannot be too strongly emphasized from the standpoint of the retailer and the consumer. The fungi causing storage rots usually gain entrance to the fruit through wounds, insect punctures and bruises. The common storage diseases encountered in this province are Blue mould rot, Brown rot, Black rot and Geosporium rot. The latter rot appears to be a new

one in so far as the apple is concerned.

### Bitter Pit

This disease is not caused by a fungus or bacterium. It is increasing in importance in New Brunswick, and appears to be linked up with the nutritional balance of the tree. Bitter Pit is a disease that is confined to the fruit and does not make its appearance until the apples are half grown. Sometimes it is not noticeable until late fall or in storage. The first external symptom of the disease is the appearance of slightly discoloured spots. At first these spots are not depressed but as the season advances they become more or less sunken and assume the typical characteristics of the Bitter Pit.

Owing to the fact that many soils in the province are deficient in boron as evidenced by the occurrence of brown heart in turnips, found at this laboratory to be due to a lack of this element and the similarity of Bitter Pit to the turnip disease, investigations were conducted to determine the relative efficiency of various boron salts toward the control of this malady. Preliminary trials yielded results which encourage further investigation of this important disease, along the line already projected.

It pays to advertise in The Daily Mail.
